TastePrompt

The Problem

- Everyone has their own personal taste but nobody can explain it
- People curate moodboards that capture their visual language perfectly but there's no way to use that as context when prompting AI
- Not everyone has the same eye, sometimes you want to borrow someone else's taste and prompt through their aesthetic
- Before AI, if you wanted to develop your taste you had to follow the right blogs, the right Tumblrs, the right people and slowly absorb it over years

What TastePrompt Does

- Upload images you love, Claude's vision API extracts the visual DNA from each one: palette, mood, composition, lighting, influences
- Multiple images stack up into a profile, Claude synthesizes across all of them and finds patterns you might not even notice yourself
- That profile becomes a shareable taste fingerprint
- Anyone can load a profile and prompt against it
- One profile, endless use cases: branding, interiors, travel, gifting, creative direction

How it works

- User uploads images to their profile
- Claude vision API analyzes each image individually, extracting structured aesthetics as JSON
- As images accumulate the profile gets richer and more specific
- Claude synthesizes across all analyses to build a taste fingerprint, the connective thread across everything you uploaded
- Profiles are stored and shareable, anyone can load one
- When you prompt, the full profile gets injected as context so Claude's output is shaped by that taste
- Multi-profile blending: load two or more profiles and query the intersection, the contrast, or a mix

Ethics + Safeguards

- This empowers personal expression rather than replacing it
- The tool doesn't tell you what to like, it helps you use what you already like
- Potential risk: profiles could oversimplify someone's taste.

  Safeguard: users curate and refine their own profiles

Demo: Profile Building

- This profile was built from 200 Tumblr images
- Claude's vision API analyzed each one and extracted structured aesthetics as JSON
- Those individual analyses are then synthesized together into a single taste fingerprint that captures the patterns across all 200 images

Future Additions

- More modalities beyond images: music, text, film, food
- Richer blending strategies: weighted mixes, contrast mode to find where two people's taste clashes
- Taste compatibility scores between profiles
- Export profiles as a portable standard you can bring to any AI tool
- Community profiles: browse and borrow taste from curators, designers, creatives you admire
